Changing the mode in Google Sheets refers to the process of switching between different viewing options within the spreadsheet program. This allows users to adjust the layout and appearance of their data for better organization and analysis. To change the mode in Google Sheets, one can simply click on the "View" tab at the top of the screen and select the desired mode from the dropdown menu. This can include options such as "Normal" mode for standard spreadsheet viewing, "Page Layout" mode for adjusting the print settings, and "Split" mode for viewing multiple sections of the sheet at once. By changing the mode, users can customize their experience in Google Sheets and make their data more accessible and visually appealing.

MODE

Returns the most commonly occurring value in a dataset.

Sample Usage

```
MODE(A2:A100, B2:B100, 4, 26)
```

```
MODE(1, 2, 3, 4, 5, C6:C20)
```

Syntax

```
MODE(value1, )
```

`value1` - The first value or range to consider when calculating mode.

`value2, ...` - - Additional values or ranges to consider when calculating mode.

Notes

Although `MODE` is specified as taking a maximum of 30 arguments, Google Sheets supports an arbitrary number of arguments for this function.

See Also

`DCOUNTA`: Counts values, including text, selected from a database table-like array or range using a SQL-like query.

`DCOUNT`: Counts numeric values selected from a database table-like array or range using a SQL-like query.
