How can I check which version of a package is currently loaded in R?

Authored by

To check the current version of a package in R, use the "packageVersion()" function. This function takes the name of the package as its argument and returns the version number. It can be useful when troubleshooting issues or ensuring compatibility with other packages.

Check which Package Version is Loaded in R

You can use the following functions to check which package version is loaded in R:

```
#display package version
packageVersion("ggplot2")

#display the date when this package version was released
packageDate("ggplot2")

#display description of the package
packageDescription("ggplot2")
```

The following example shows how to use these functions in practice.

Example: Check which Package Version is Loaded in R

Suppose we load the ggplot2 package in our current R environment:

library(ggplot2)

We can use the packageVersion() function to check which version of ggplot2 is loaded:

#display package version
packageVersion("ggplot2")

'3.3.2'

We can see that version 3.2.2 is loaded.

To find out when this version was released, we can use the packageDate() function:

#display the date when this package version was released
packageDate("ggplot2")

"2020-06-17"

We can see that this version was released on June 17, 2020.

And to view a description of the package, we can use

the packageDescription() function:

#display description of the package
packageDescription("ggplot2")

Package: ggplot2
Version: 3.3.2
Title: Create Elegant Data Visualisations Using the Grammar of Graphics
Description: A system for 'declaratively' creating graphics, based on
"The Grammar of Graphics". You provide the data, tell 'ggplot2'
how to map variables to aesthetics, what graphical primitives
to use, and it takes care of the details.
