Google Sheets is a powerful tool that can be used to find the greatest common divisor (GCD) of two or more numbers. To do this, first enter the numbers whose GCD you want to find into a column in your Google Sheet. Next, use the GCD function, which can be found under the "Math" category in the "Insert Function" menu, to calculate the GCD of these numbers. The result will be displayed in the cell where the function is entered. This quick and easy method allows users to efficiently find the GCD of any set of numbers using Google Sheets.

GCD

Returns the greatest common divisor of one or more integers.

Sample Usage

```
GCD(A2:A5)
```

```
GCD(24,96,A4)
```

Syntax

```
GCD(value1, )
```

`value1` - The first value or range whose factors to consider in a calculation to find the greatest common divisor.

`value2, ...` - - Additional values or ranges whose factors to consider to find the greatest common divisor.

Notes

Any input with a decimal part provided to `GCD` will be silently truncated.

See Also

`LCM`: Returns the least common multiple of one or more integers.
