## RECOMMENDED CITATION

stats writer (2024). *How can I fix the error “xy.coords(x, y, xlabel, ylabel, log) : ‘x’ and ‘y’ lengths differ” in my code?*. PSYCHOLOGICAL SCALES. Retrieved from <https://scales.arabpsychology.com/?p=141685>

The error "xy.coords(x, y, xlabel, ylabel, log) : 'x' and 'y' lengths differ" is a common error that occurs when there is a mismatch in the lengths of the 'x' and 'y' variables in a code. This error can be fixed by carefully checking the input data and making sure that the 'x' and 'y' variables have the same length. If the issue persists, it may be necessary to review the code and make adjustments to ensure that the 'x' and 'y' variables are being properly referenced. It is also important to check that the correct syntax and parameters are being used when calling the xy.coords() function. By addressing these potential issues, the error can be resolved and the code can be successfully executed.

## **Fix: error in xy.coords(x, y, xlabel, ylabel, log) : 'x' and 'y' lengths differ**

**One common error you may encounter in R is:**

**Error in xy.coords(x, y, xlabel, ylabel, log) :  
'x' and 'y' lengths differ**

**This error occurs when you attempt to create a plot of two variables but the variables don't have the same length.**

**This tutorial shares exactly how to fix this error.**

**How to Reproduce the Error**

**Suppose we attempt to create a scatterplot of the following two variables in R:**

**#define x and y variables**

```
x <- c(2, 5, 5, 8)
y <- c(22, 28, 32, 35, 40, 41)
```

```
#attempt to create scatterplot of x vs. y
plot(x, y)
```

```
Error in xy.coords(x, y, xlabel, ylabel, log) :
'x' and 'y' lengths differ
```

We receive an error because the length of x and y are not equal.

We can confirm this by printing the length of each variable:

```
#print length of x
length(x)
```

4

```
#print length of y
length(y)
```

6

```
#check if length of x and y are equal
```

**length(x) == length(y)**

**FALSE**

**How to Fix the Error**

**The easiest way to fix this error is to simply make sure that both vectors have the same length:**

**#define x and y variables to have same length**

**x <- c(2, 5, 5, 8, 9, 12)**

**y <- c(22, 28, 32, 35, 40, 41)**

**#confirm that x and y are the same length**

**length(x) == length(y)**

**TRUE**

**create scatterplot of x vs. y**

**plot(x, y)**

If one vector happens to be shorter than the other, you could choose to plot only the values up to the length of the shorter vector.

For example, if vector x has 4 values and vector y has 6 values, we could create a scatterplot using only the first 4 values of each vector:

**#define x and y variables**

```
x <- c(2, 5, 5, 8)
```

```
y <- c(22, 28, 32, 35, 40, 41)
```

```
#create scatterplot of first 4 pairwise values of x vs. y  
plot(x, y)
```

**Notice that only the first four values of each vector are used to create the scatterplot.**
