PSYCHOLOGICAL SCALES. Retrieved from <https://scales.arabpsychology.com/?p=160225>

The ROW function in Google Sheets is a tool that allows users to retrieve the row number of a specific cell or range of cells. This function can be used to quickly identify the location of data within a spreadsheet and is especially useful for data analysis and organization. To use the ROW function, simply input the cell reference or range into the function, and it will return the row number of that particular cell or range. This feature is easily accessible in Google Sheets and can greatly improve efficiency and accuracy in data management.

ROW

Returns the row number of a specified cell.

Sample Usage

`ROW(A9)`

Syntax

`ROW()`

`cell_reference` - - The cell whose row number will be returned.

if `cell_reference` is a range more than one cell wide and the formula is not used as an array formula, only the numeric value of the first row in `cell_reference` is returned.

See Also

`ROWS`: Returns the number of rows in a specified array or range.

`COLUMNS`: Returns the number of columns in a specified array or range.

`COLUMN`: Returns the column number of a specified cell, with `A=1`.

Examples

Returns the row number of a cell reference.
