DOLLAR is a built-in function in Google Sheets that allows users to easily format numerical values into currency format. This function is useful for organizing and presenting financial data in a clear and professional manner. To use DOLLAR, simply enter the formula "`=DOLLAR(value, decimal places)`" into a cell in your spreadsheet, where "value" is the numerical value you want to format and "decimal places" is the number of decimal places you want to display. This will automatically convert the value into the currency format based on your chosen decimal places. This feature is particularly helpful for businesses, finance professionals, and individuals who need to work with monetary data in their spreadsheets.

DOLLAR

Formats a number into the locale-specific currency format.

Sample Usage

```
DOLLAR(1.2351, 4)
```

```
DOLLAR(2.35)
```

Syntax

```
DOLLAR(number, )
```

`number` - The value to be formatted.

`number_of_places` - - The number of decimal places to display.

Notes

The currency format used by `DOLLAR` is specific to your spreadsheet locale.

`DOLLAR` differs from the related function `TO_DOLLARS` in that `DOLLAR` outputs text rather than applying a cell format to a number.

See Also

`TO_DOLLARS`: Converts a provided number to a dollar value.
