The GESTEP function in Excel is a useful tool that allows users to determine whether a given value is greater than or equal to another specified value. This function returns a binary value of either 1 (TRUE) or 0 (FALSE) depending on the comparison result. To use the GESTEP function, simply specify the values to be compared in the formula and the function will automatically calculate and return the appropriate result. This function can be particularly helpful in data analysis and decision-making tasks.

This article describes the formula syntax and usage of the **GESTEP** function in Microsoft Excel.

Description

Returns 1 if number \geq step; returns 0 (zero) otherwise. Use this function to filter a set of values. For example, by summing several GESTEP functions you calculate the count of values that exceed a threshold.

Syntax

GESTEP(number,)

The GESTEP function syntax has the following arguments:

Number Required. The value to test against step.

Step Optional. The threshold value. If you omit a value for step, GESTEP uses zero.

Remark

If any argument is nonnumeric, GESTEP returns the #VALUE! error value.
