The ISFORMULA function in Excel is a useful tool that allows users to quickly and easily determine if a cell contains a formula. This function can be used in various scenarios, such as checking for hidden formulas in a spreadsheet or verifying the accuracy of formulas in a large dataset. By entering the cell reference as the argument for the ISFORMULA function, the result will be either TRUE or FALSE, indicating if the cell contains a formula or not. This function can save time and improve the efficiency of data analysis in Excel.

This article describes the formula syntax and usage of the ISFORMULA function in Microsoft Excel.

Description

Checks whether there is a reference to a cell that contains a formula, and returns TRUE or FALSE.

Syntax

ISFORMULA(reference)

The ISFORMULA function syntax has the following arguments.

Reference Required. Reference is a reference to the cell you want to test. Reference can be a cell reference, a formula, or a name that refers to a cell.

Remarks

If reference is not a valid data type, such as a defined name that is not a reference, ISFORMULA returns the #VALUE! error value.
