## RECOMMENDED CITATION

stats writer (2024). *How can I use the RANDBETWEEN function in Google Sheets?*. PSYCHOLOGICAL SCALES. Retrieved from <https://scales.arabpsychology.com/?p=161319>

The RANDBETWEEN function in Google Sheets allows users to generate a random integer within a specified range. This can be useful for creating randomized data sets or selecting random values for analysis. To use this function, simply input the minimum and maximum values of the desired range into the formula. The function will then generate a new random number each time the sheet is recalculated. This can be especially helpful in scenarios such as creating randomized surveys or conducting statistical simulations. By utilizing the RANDBETWEEN function, users can easily add a random element to their data in Google Sheets.

## RANDBETWEEN

Returns a uniformly random integer between two values, inclusive.

### Sample Usage

```
RANDBETWEEN(1,10)
```

```
RANDBETWEEN(A2,A3)
```

### Syntax

```
RANDBETWEEN(low, high)
```

**low** - The low end of the random range.

**high** - The high end of the random range.

### Notes

Values with decimal parts may be used for **low** and/or **high**; this will cause the least and greatest possible values to be the next integer greater than **low** and/or the next integer less than **high**, respectively.

### See Also

**RAND**: Returns a random number between 0 inclusive and 1 exclusive.
