The RANK.AVG function in Google Sheets allows users to determine the average rank of a set of values. This function takes into account ties and assigns each value a rank based on its position in the set. By using this function, users can easily calculate the average rank of a group of values, providing a quick and efficient way to analyze data. This can be particularly useful in situations where there are ties among the values, as it provides a more accurate representation of the data. Overall, the RANK.AVG function is a valuable tool for organizing and analyzing numerical data in Google Sheets.

RANK.AVG

Returns the rank of a specified value in a dataset. If there is more than one entry of the same value in the dataset, the average rank of the entries will be returned.

Sample Usage

```
RANK.AVG(A10, A1:A100, TRUE)
```

```
RANK.AVG(B32, B8:B47, FALSE)
```

```
RANK.AVG(A10, A1:A100)
```

Syntax

```
RANK.AVG(value, data, )
```

value - The value whose rank will be determined.

data - The array or range containing the dataset to consider.

is_ascending - - Whether to consider the values in *data* in descending or ascending order.

See Also

RANK: Returns the rank of a specified value in a dataset.

RANK.EQ: Returns the rank of a specified value in a dataset. If there is more than one entry of the same value in the dataset, the top rank of the entries will be returned.
