Google Sheets is a cloud-based spreadsheet program developed by Google. It allows users to create and edit spreadsheets online, as well as collaborate with others in real-time. To write code in Google Sheets, you can use the built-in scripting language called Google Apps Script. This language is based on JavaScript and allows you to automate tasks, add custom functions, and create macros within your spreadsheet. By utilizing Google Apps Script, you can enhance the functionality of your spreadsheet and streamline your workflow.

CODE

Returns the numeric Unicode map value of the first character in the string provided.

Sample Usage

```
CODE("a")
```

```
CODE(A1)
```

Syntax

```
CODE(string)
```

`string` - The string whose first character's Unicode map value will be returned.

Notes

Only the first character in `string` will be evaluated; others will be ignored.

See Also

`CHAR`: Convert a number into a character according to the current Unicode table.
