RECOMMENDED CITATION

stats writer (2024). *How do I use the VLOOKUP function in Google Sheets?*.

PSYCHOLOGICAL SCALES. Retrieved from <https://scales.arabpsychology.com/?p=160281>

The VLOOKUP function is a useful tool in Google Sheets that allows users to search for a specific value in a table and retrieve information associated with that value. To use this function, first select the cell where you want the result to appear, then enter "=VLOOKUP" followed by an open parenthesis. Next, enter the search value, the range of cells to search within, the column number containing the desired information, and whether the search should be an exact match or not. Finally, close the parenthesis and hit enter to get the desired result. This function can be helpful for quickly finding and organizing data in your Google Sheets.

VLOOKUP

If you have known information on your spreadsheet, you can use VLOOKUP to search for related information by row. For example, if you want to buy an orange, you can use VLOOKUP to search for the price.

The screenshot shows a Google Sheet with a table of fruit prices. The formula bar at the top contains the formula: `= VLOOKUP(G3,B4:D8,3,FALSE)`. An arrow labeled "formula" points to the formula bar. The table has columns for Fruit, Quantity, and Price. The value "Orange" is entered in cell G3, and the result "\$1.01" is shown in cell F3. An arrow labeled "index" points to the number 3 in the formula, indicating the column index for the Price column. Another arrow labeled "search_key" points to the "Orange" value in G3. A third arrow labeled "return value" points to the "\$1.01" result in F3. Below the table, two arrows point to the "Fruit" and "Price" columns, labeled "search_key column" and "return value column determined by index" respectively.

	A	B	C	D	E	F	G	H
1								
2		1	2	3				
3		Fruit	Quantity	Price		Fruit	Orange	
4		Apple	11	\$1.50		Price	\$1.01	
5		Banana	15	\$2.03				
6		Lemon	9	\$3.10				
7		Orange	5	\$1.01				
8		Peach	6	\$2.00				
9								

VLOOKUP for BigQuery

Vertical lookup. Returns the values in a data column at the position where a match was found in the search column.

Sample Usage

```
VLOOKUP("Apple",table_name!fruit,table_name!price)
```

Syntax

```
VLOOKUP(search_key, range,index, is_sorted)
```

search_key: The value to search for in the search column.**search_column**: The data column to consider for the search.**result_column**: The data column to consider for the result.**is_sorted**: The manner in which to find a match for the **search_key**.

FALSE: For an exact match, this is recommended.**TRUE**: For an approximate match, this is the default if **is_sorted** is unspecified.

Tip: Before you use an approximate match, sort your search key in ascending order. Otherwise, you may likely get a wrong return value. Learn why you may encounter a wrong return value.

Tip: For more flexible database queries in BigQuery, use XLOOKUP.

Syntax

```
=VLOOKUP(search_key, range, index, )
```

Inputs

search_key: The value to search for in the first column of the range.**range**: The upper and lower values to consider for the search.**index**: The index of the column with the return value of the range. The index must be a positive integer.**is_sorted**: Optional input. Choose an option:

FALSE = Exact match. This is recommended.**TRUE** = Approximate match. This is the default if **is_sorted** is unspecified.

Important: Before you use an approximate match, sort your search key in ascending order. Otherwise, you may likely get a wrong return value. Learn why you may encounter a wrong return value.

Return value

The first matched value from the selected **range**.

Technical details:

Example: =VLOOKUP(G9, B4:D8, 3, FALSE)=VLOOKUP("Apple", B4:D8, 3, TRUE)

Inputs	Description
search_key	This is the value you search in the first column of the range . If you expect a non-error value, the search key must be in the first column of the range . Cell reference is also supported. To do a simple check: If your search_key is located at B3, then your range should start with column B.
range	This is the range where: The function searches for the specified search key in its first column. VLOOKUP returns the value from the column specified by index . You can also use a named range. To return a non-error value, your search key must be in the first column of the range . To do a simple check: If your search_key is located at B3, then your range should start with column B.

<code>index</code>	Also called "Column number." This is the index of the column in the <code>range</code> that contains the return value. The smallest possible index is 1. The largest possible index is the maximum number of columns in that <code>range</code> . After you set up the range, <code>VLOOKUP</code> only looks to the search key column, when <code>index = 1</code> , or columns that are further right. Tip: When you use <code>VLOOKUP</code> , imagine that the columns of the <code>range</code> are numbered from left to right and start with 1.
<code>is_sorted</code>	This is an optional input. The two available choices are <code>TRUE</code> and <code>FALSE</code> . If <code>is_sorted</code> is <code>TRUE</code> , then <code>VLOOKUP</code> uses approximate match. Important: Before you use an approximate match, sort your search key in ascending order. Otherwise, you may get an unexpected value returned. Learn why you may encounter a wrong return value. If <code>is_sorted</code> is <code>FALSE</code> , then <code>VLOOKUP</code> uses exact match. If <code>is_sorted</code> is not specified, it is <code>TRUE</code> by default. We strongly recommend you: Use <code>FALSE</code> for <code>is_sorted</code> due to its consistent behavior whether or not the search key column is sorted. Always specify <code>is_sorted</code> for better readability, even though the input is optional.

Outputs	Description
Return value	This is the value that <code>VLOOKUP</code> returns based on your inputs. There's only one return value from each <code>VLOOKUP</code> function. If there are multiple search key values that match, the value in the return value column whose associated search key is first matched in the search key column is returned. If <code>#N/A</code> is returned, a value isn't found. If you encounter an expected value or error like <code>#N/A</code> or <code>#VALUE!</code> , begin to troubleshoot. If you want to replace <code>#N/A</code> with another value, learn more about how to use <code>IFNA()</code> on <code>VLOOKUP()</code> .

Basic VLOOKUP examples:

VLOOKUP on different search keys

Use `VLOOKUP` to find the price of an Orange and Apple.

G10 fx = VLOOKUP(G9,B4:D8,3,FALSE) ← formula when search key = G9

	A	B	C	D	E	F	G
1							
2							
3		Fruit	Quantity	Price		Fruit	Orange
4		Apple	11	\$1.50		Price	\$1.01
5		Banana	15	\$2.03			
6		Lemon	9	\$3.10		Fruit	Apple
7		Orange	5	\$1.01		Price	\$1.50
8		Peach	6	\$2.00			
9						Fruit	Apple ← Cell G9
10						Price	\$1.50
11							

Try it out

Explanation:

When you use `VLOOKUP`, you can use different search keys such as "Apple" and "Orange."

To return a non-error value, these search keys must be in the first column of the `range`. If you don't want to fill a value for search keys, you can also use a cell reference, for example "G9."

search_key is "Orange"	=VLOOKUP("Orange", B4:D8, 3, FALSE)Return value = \$1.01
search_key is "Apple"	=VLOOKUP("Apple", B4:D8, 3, FALSE)Return value = \$1.50
search_key that uses cell reference of "Apple" in G9	=VLOOKUP(G9, B4:D8, 3, FALSE)Return value = \$1.50

VLOOKUP on different column indexes

Use `VLOOKUP` to find the quantity of Oranges in the second index column.

fx = VLOOKUP(G3,B4:D8,2, FALSE)

	A	B	C	D	E	F	G
1							
2		1	2	3			
3		Fruit	Quantity	Price		Fruit	Orange
4		Apple	11	\$1.50		Quantity	5
5		Banana	15	\$2.03			
6		Lemon	9	\$3.10			
7		Orange	5	\$1.01			
8		Peach	6	\$2.00			
9							

Try it out

Explanation:

When you use VLOOKUP, imagine that the columns of the range are numbered from left to right and start from 1. To find the target information, you must specify its column index. For example, column 2 for quantity.

Index = 2 Find the quantity of oranges, which is the second column of the range.	=VLOOKUP(G3, B4:D8, 2, FALSE) Return value = 5
--	--

VLOOKUP exact match or approximate match

Use VLOOKUP exact match to find an exact ID. Use VLOOKUP approximate match to find the approximate ID.

fx = VLOOKUP(G3,A4:D8,2,TRUE) ← formula with approximate match

	A	B	C	D	E	F	G
1						ID=102 doesn't exist in ID column	
2							
3	ID	Fruit	Quantity	Price		ID (Approx. Match)	102
4	101	Apple	2	\$1.50		Fruit	Apple
5	103	Banana	4	\$2.03			
6	105	Lemon	5	\$3.10		ID (Exact Match)	103
7	106	Orange	6	\$1.01		Fruit	Banana
8	110	Peach	7	\$2.00			
9							
10							

Try it out

Explanation:

Use an approximate match or `is_sorted = TRUE` when you search for a best match, but not an exact match. If you want to search ID = 102, which doesn't exist in the table, an approximate match takes one step back to give you ID = 101 as the result. This is because in the search key column, 101 is the closest value that is also less than 102. An approximate match searches down the search key column until it finds a value that is larger than your search key. Then it stops on the row before the larger value and returns the value from the return value column on that row. That means if your search key column is not sorted in ascending order, you most likely get a wrong return value. **Important:** Before you use an approximate match, sort your search key in ascending order to return the correct value. Otherwise, you may get an unexpected value returned. When you search for the exact match, such as `is_sorted = FALSE`, it returns an exact match. For example, the fruit name for ID = 103 is "Banana." If there's no exact match, you get a #N/A error. Due to its more predictable behavior, we recommend you use exact match.

Exact match	<code>=VLOOKUP(G6, A4:D8, 2, FALSE)</code> Return value = "Apple"
Approximate match	<code>=VLOOKUP(G3, A4:D8, 2, TRUE)</code> OR <code>=VLOOKUP(G3, A4:D8, 2)</code> Return value = "Banana"

Common VLOOKUP applications

Replace error value from VLOOKUP

You may want to replace an error value returned by `VLOOKUP` when your search key doesn't exist. In this case, if you don't want #N/A, you can use `IFNA()` functions to replace #N/A. Learn more about `IFNA()`.

IFNA() on VLOOKUP()

`=IFNA(VLOOKUP(G3,B4:D8,3,FALSE), "NOT FOUND")` ← replaced value

	A	B	C	D	E	F	G	H
1								
2								
3		Fruit	Quantity	Price		Fruit	Pencil	
4		Apple	11	\$1.50		Price	NOT FOUND	
5		Banana	15	\$2.03				
6		Lemon	9	\$3.10				
7		Orange	5	\$1.01				
8		Peach	6	\$2.00				
9								

Try it out

<p>Originally, <code>VLOOKUP</code> returns #N/A because the search key "Pencil" does not exist in the "Fruit" column. <code>IFNA()</code> replaces #N/A error with the second input specified in the function. In our case, it's "NOT FOUND."</p>	<p><code>=IFNA(VLOOKUP(G3, B4:D8, 3, FALSE), "NOT FOUND")</code> Return value = "NOT FOUND"</p>
--	---

Tip: If you want to replace other errors such as #REF!, learn more about `IFERROR()`.

VLOOKUP with multiple criteria

`VLOOKUP` can't be directly applied on multiple criteria. Instead, create a new helper column to directly apply `VLOOKUP` on multiple criteria to combine multiple existing columns.

`= VLOOKUP(H3&H4, B4:E8, 4, FALSE)` ← use helper as search key

	A	B	C	D	E	F	G	H
1								
2	new helper column							
3		Helper	First Name	Last Name	Department		First Name	John
4		SteveLee	Steve	Lee	Marketing		Last Name	Lee
5		JohnSnow	John	Snow	Product		Department	Support
6		MiaJan	Mia	Jan	Product			
7		JohnLee	John	Lee	Support			
8		TimJackson	Tim	Jackson	Operations			
9								
10								

Try it out

<p>1. You can create a Helper column if you use "&" to combine First Name and Last Name.</p>	<p><code>=C4&D4</code> and drag it down from B4 to B8 gives you the Helper column.</p>
<p>2. Use cell reference B7, JohnLee, as the search key.</p>	<p><code>=VLOOKUP(B7, B4:E8, 4, FALSE)</code> Return value = "Support"</p>

VLOOKUP with wildcard or partial matches

In `VLOOKUP`, you can also use wildcards or partial matches. You can use these wildcard characters: A question mark "?" matches any single character. An asterisk "*" matches any sequence of characters. To use wildcards in `VLOOKUP`, you must use an exact match: `"is_sorted = FALSE"`.

`=VLOOKUP("St*",B4:D8,3,FALSE)` ← search key with wildcard

	A	B	C	D	E	F	G	H
1								
2								
3		First Name	Last Name	Department				
4		Steve	Lee	Marketing				
5		John	Snow	Product		First name starts with "St"	Marketing	
6		Mia	Jan	Product				
7		John	Lee	Support				
8		Tim	Jackson	Operations				
9								
10								

Try it out

"St*" is used to match anything that starts with "St" regardless of the number of characters, such as "Steve", "St1", "Stock", or "Steeeeeeve".	=VLOOKUP("St*", B4:D8, 3, FALSE)Return value = "Marketing"
---	--

Troubleshoot errors & best practices:

Wrong return value

Returns an unexpected value: If you set `is_sorted` as `TRUE`, but your first column in the range isn't sorted numerically or alphabetically in ascending order, then change `is_sorted` to `FALSE`.

VLOOKUP gives the first match: `VLOOKUP` only returns the first match. If you have multiple matched search keys, a value is returned, but it may not be the expected value. **Unclean data:** Sometimes, values with spaces that trail and lead may seem similar but `VLOOKUP` treats them differently. For example, the following are different to `VLOOKUP`:

" Apple""Apple ""Apple" To get your expected results, remove spaces before you use `VLOOKUP`. To learn more, check out our best practice section.

#N/A

If `approximate` or `is_sorted = TRUE` is used and if the search key in `VLOOKUP` is smaller than the smallest value in the first column, then `VLOOKUP` returns `#N/A`. If `exact match` or `is_sorted = FALSE` is used, then the exact match of the search key in `VLOOKUP` isn't found in the first column. If you don't want `#N/A` when the search key isn't found in the first column, you can use the function `IFNA()`.

#REF!

You might mistakenly specify a `range` with a number bigger than the maximum number of columns

of the `range`. To avoid this, make sure you: Count the columns from the selected `range`, not the entire table. Start to count from 1 instead of 0.

#VALUE!

If you get #VALUE! error, you might have: Incorrectly input the text or the column name for the `index`. Entered a number smaller than 1 for the `index`. The `index` must be at least equal to 1 and smaller than the maximum number of columns of the `range`. VLOOKUP can only search in the search key column, when `index = 1`, or columns that are further right.

Important: `index` only accepts a number.

#NAME?

You might have missed a quote in the search key when your `search_key` is text data.

Best practices

To do	Reason
Use absolute references for <code>range</code>	You should use: Absolute reference for VLOOKUP <code>VLOOKUP(G3, \$B\$3:\$D\$7, 3, FALSE)</code> You should not use: <code>VLOOKUP(G3, B3:D7, 3, FALSE)</code> This prevents unpredictable changes in the <code>range</code> when it's copied or dragged down.
Sort the first column in ascending order when you use an approximate match, such as <code>is_sorted = TRUE</code> .	If you use an approximate match or <code>is_sorted = TRUE</code> , you must sort the first column in ascending order. Otherwise, you most likely get a wrong return value. Learn more on how to sort.
Clean your data before you use VLOOKUP	Before you use VLOOKUP, remember to clean your data. Unclean data may cause VLOOKUP to return an unpredictable value. Here are some common pitfalls of unclean data: Spaces that lead: " apple" Spaces that trail: "apple" Blanks or spaces: "" and " " aren't equivalent To trim white space that leads > > and trails, you can use Data Data cleanup Trim whitespace .
Don't store number or date values as text	Make sure your date or number values in the first column of your VLOOKUP range, such as the search key column, aren't stored as text values. You may get an unexpected return value. On the top of Sheets, select your search key > column. Tap Format Menu Number . Choose an option depending on your desired data type: Date Number
