RECOMMENDED CITATION

mohammad looti (2025). *Hyperfocus*. PSYCHOLOGICAL SCALES. Retrieved from <https://scales.arabpsychology.com/?p=30698>

Hyperfocus is an intense and deep concentration on a subject, task, or item. It is a common symptom of ADHD with the focus being so intense that it is difficult to be interrupted and focus on other things. Typically ADHD sufferers have difficulty focusing on subjects or topics that do not interest them but subjects that do interest them can be subject to hyperfocus.
